Some brief background. Occassionally, I have students cheat on their essays or long-answer questions, typically by copying their answers from somewhere. My university provides access to plagiarism detection services like turnitin and safeassign, however these tools can be cumbersome to use. I have also sometimes resorted to using R for plagiarism detection. I am writing this package to collect my code for this purpose and put it one place.

Also, I am using this vignette as a pseudo blog to work out which kinds of functions to focus on building. So, this is a tutorial for myself.
